Thawte SSL Wildcard

Using a Thawte SSL Wildcard server certificate makes it possible to secure all sub-domains of a main domain (such as *.domain.com) at the same time, allowing you to save both time and money.

Thawte Wildcard is an efficient product that goes along with its well-known Trust Seal.

trust booster

TBS INTERNET was founded in 1996 by IT security specialists to help companies comply with encryption best practices. Customers include leading companies, value-added resellers and public sectors.

Since the early days, TBS INTERNET offered a highly professional service issuing as well as installing digital certificates for its clients. As Internet usage grew and companies began to require specialized online security, it was the first to create a multi-brand digital certificate platform, securing platinum partnerships with major SSL providers.

Thanks to it's own certification authority "TBS X509" the company can provide competitive authenticated certificates very well supported in browsers.

Founded in 1995, Thawte was the first certification authority to issue SSL certificates outside of the United States.

It's international success was great and was purchased by Verisign in 2001 and then Symantec. It has recently joined forces into the DigiCert Corporation as part of the Symantec Website Security activity.

the trust seal

Equipment
Any kind of server
Any kind of browser

Functionalities
